An HSUS Report: Welfare Issues with Genetic Engineering and Cloning of Farm Animals

Abstract

Developments in biotechnology have raised new concerns about animal welfare, as farm animals now have their genomes modified (genetically engineered) or copied (cloned) to propagate certain traits useful to agribusiness, such as meat yield or feed conversion. These animals have been found to suffer from unusually high rates of birth defects, disabilities, and premature death. In the United States, there is significant public opposition to the introduction of meat and milk from cloned animals and their progeny into the food supply and currently no regulations exist to protect the welfare of farm animals during cloning or genetic engineering agricultural research.

American Angus Association EPDs, 10/2016

PRODUCTION								MATERNAL							CARCASS			
CED	BW	WW	YW	RADG	DMI	YH	SC	Doc	HP	CEM	Milk	MW	MH	\$EN	CW	Marb	RE	Fat

The diagram shows a table of EPDs. The first row is divided into three sections: PRODUCTION (8 columns), MATERNAL (7 columns), and CARCASS (4 columns). The second row lists the specific EPDs: CED, BW, WW, YW, RADG, DMI, YH, SC, Doc, HP, CEM, Milk, MW, MH, \$EN, CW, Marb, RE, and Fat. The EPDs CED, BW, Doc, HP, and CEM are circled in blue. Arrows point from these circled EPDs to a text block below the table. Specifically, arrows point from CED and BW to the text, and from Doc, HP, and CEM to the text.

EPDs related to animal welfare (i.e., ability to cope with environment)

Benefits of GMO Livestock

- Modify phenotype faster than through traditional genetic selection
 - Sometimes in ways not possible through traditional genetic selection strategies
- Potential to improve
 - Agricultural productivity & composition
 - Environment (“sustainability”)
 - **Disease resistance and animal welfare**

COLUMBIA, Mo. (University of Missouri) - Porcine Reproductive and Respiratory Syndrome virus was first detected in the U.S. in 1987. Pigs that contract the disease have extreme difficulty reproducing, don't gain weight and have a high mortality rate.

To date, no vaccine has been effective, and the disease costs North American farmers more than \$660 million annually.

Now, a team of researchers from the University of Missouri, Kansas State University, and Genus plc have bred pigs that are not harmed by the disease.

Production of cattle lacking prion protein

Jürgen A Richt^{1,6}, Poothappillai Kasinathan², Amir N Hamir¹, Joaquin Castilla³, Thillai Sathiyaseelan², Francisco Vargas¹, Janaki Sathiyaseelan², Hua Wu², Hiroaki Matsushita², Julie Koster², Shinichiro Kato^{4,5}, Isao Ishida⁴, Claudio Soto³, James M Robl² & Yoshimi Kuroiwa^{4,5,6}

Prion diseases are caused by propagation of misfolded forms of the normal cellular prion protein PrP^C, such as PrP^{BSE} in bovine spongiform encephalopathy (BSE) in cattle and PrP^{CJD} in Creutzfeldt-Jakob disease (CJD) in humans¹. Disruption of PrP^C expression in mice, a species that does not naturally contract prion diseases, results in no apparent developmental abnormalities^{2,3,4,5}. However, the impact of ablating PrP^C function in natural host species of prion diseases is unknown. Here we report the generation and characterization of PrP^C-deficient cattle produced by a sequential gene-targeting system⁶. At over 20 months of age, the cattle are clinically, physiologically, histopathologically, immunologically and reproductively normal. Brain tissue homogenates are resistant to prion propagation *in vitro* as assessed by protein misfolding cyclic amplification⁷. PrP^C-deficient cattle may be a useful model for prion research and could provide industrial bovine products free of prion proteins.

Animal welfare concerns

- Unintended consequences?
 - Insertion of GH gene in pigs
 - Affects on survival and welfare
- Public perception

SOUTH DAKOTA STATE UNIVERSITY

College of Agriculture and Biological Sciences

Consumer Perceptions of Food Technology, 2012

- 69% of consumers stated it was important that foods are produced sustainably
- 67-71% of consumers stated it was somewhat likely or very likely that they would purchase GE meat, dairy, or fish

Consumer Perceptions of Food Technology, 2012

- 58% of consumers had a favorable or neutral impression of animal biotechnology
 - 16% of consumers did not know how to answer.
 - 26% of consumers had an unfavorable view of animal biotechnology
 - **42% of these consumers did not understand the benefits of animal biotechnology**

Take Home Messages

- Need for consistent regulations/approval processes for livestock GMOs
- Consumers are not, by default, against animal biotechnology
 - Especially if used to benefit animal welfare
- Education and transparency are key
